

# ENPM 809T

UMCP, Mitchell

# Python

- Python is an *interpreted* programming language
  - First released in 1991
- Source code file is read line-by-line and each statement is converted into machine language and executed before the next line is read
- Compiled languages are generally more efficient and faster than interpreted languages
  - The conversion to machine language only occurs one time
  - Then the machine language code can be executed whenever the program needs to be run
- Interpreted languages are often more *flexible* and changes can be easily made to the program at runtime

# Python

- Unlike Matlab, Python is **open source**
- Python can be installed on any computer
- The source code is available for inspection
- Support and development are community driven (good...and bad)

# Python

- Python has recently undergone a major redesign
- Python 3.x
  - Syntax has changed and is not compatible with 2.x
- Python 2.x
  - Most commonly used by scientific community
- Python 2.7
  - Bridge between the versions
  - Syntax from both will work

# Python Basics

- Comments begin with #
  - Can be at the beginning of the line or in middle
    - # This is a comment
    - A = 45 # This sets the value of A
- Python is case sensitive
  - Apple = 'red'
  - apple = 67.1
- Names cannot start with a number
- Beware of “**Reserved Words**”
- Variables are empty (None or NULL) until assigned a value

and	del	from	not	while
as	elif	global	or	with
assert	else	if	pass	yield
break	except	import	print	
class	exec	in	raise	
continue	finally	is	return	
def	for	lambda	try	

<https://docs.python.org/2.5/ref/keywords.html>

# Running a Python Program

- **python filename.py**
  - This will run the program then return to the command prompt
- **python -i filename.py**
  - Runs the program in "interactive" mode
  - When program ends, remain in the python environment and can examine the data types and values of variables

```
(pysteve) C:\Users\steve>python test.py
All packages imported properly!

(pysteve) C:\Users\steve>python -i test.py
All packages imported properly!
>>>
```

# Data Types

- Python is *dynamically typed*
- ...the opposite of *statically-typed*
  - e.g. C, C++, Java
- Most variables do not need to be declared as real, integer, string, etc.
- The type of a variable is defined by the value assigned to it
- The type of a variable can change throughout the program execution

# Data Types

- Boolean
  - Any non-Zero value becomes True
  - Zero or None is False
- Integer
  - Between -2147483648 and 2147483648 (32-bit)
  - Any integer larger, smaller, or ending in a capital L is a Long Integer
- Float
  - Automatically 64-bit or Double Precision
  - E or e indicates Scientific Notation

*<https://docs.scipy.org/doc/numpy-1.13.0/user/basics.types.html>*

# Data Types

- To determine data type
  - `type(var)`
- Casting: force data type change
  - `S = 16.6938`
  - `S = int(S)`

# Casting

- Initial data type is set by the value assigned
- Change to Float
  - `x = float(x)`
- Change to Integer
  - `x = int(x)` or `x = long(x)` for Long Integer
- Change to String
  - `x = str(x)`
- Change to Boolean
  - `x = bool(x)`

***\*Python can be quirky!  
...always consider data types***

# Strings

- Can be any combination of characters including non-ASCII
- Strings are surrounded by quotes: single, double or triple quotes
  - Triple quotes preserve formatting (`'''`, or `"""`)
- Tab ( `\t` ) and new line ( `\n` )
- Escape character is `\`
  - If you actually want the characters `\t` to be in the string, not a tab you must "escape" it.
  - `Text = "A tab is included in a string as \\t"`

# Strings

- `x = 123.456789`
- `Text = "The value of x is {0:7.2f}".format(x)`
  - `print(Text)`
  - The value of x is   123.46

# Mathematical Operators

- + Addition
- - Subtraction
- \* Multiplication
- / Division
- // truncating division
  - $16.3 // 5.2 \Rightarrow 3.0$
- \*\* power
  - $2^{**}3 = 8$
- % modulo (returns the remainder)
  - $5 \% 3 \Rightarrow 2$

# Flow Control

- User input from the command line
  - `value = input("prompt string ")`

# Flow Control

- Conditional Statements
- The conditional ends with a colon and the code block is **indented**

```
if x:  
    do this  
else:  
    do this
```

# Flow Control

- Conditional Statements
- The conditional ends with a colon and the code block is indented

```
if x < 12:
    do this
elif x >= 12 and x < 30:
    do this
    and this
    and this
else:
    do this
```

# Flow Control

- Loops
- Same format as conditionals

`while condition:`  
`Do this`

# Flow Control

- Loops
- Same format as conditionals

```
while x < 10:  
    print(x)
```

# Flow Control

- Loops
- Same format as conditionals

```
while x < 10:  
    print(x)  
    x = x + 1
```

# Flow Control

- Loops
- Same format as conditionals

```
while x < 10:  
    print(x)  
    x += 1
```

# Flow Control

- Loops
- Same format as conditionals

```
x = 0
while x < 10:
    print(x)
    x += 1
```

# Lists & Tuples

- Able to store multiple values and different data types
  - Lists
    - Values can be changed
    - `list = [ 2.5, 8.9e5, 'rain', [5,9,34.6], None]`
  - Tuples
    - Values can NOT be changed after created
    - `tuple = (2.5, 8.9e5, 'rain', [5,9,34.6], None)`

# Lists & Tuples

- Accessing Data
  - Index
    - 0 is the first value
    - -1 is the last value
    - Index represents the boundary not the value held

# Lists & Tuples

- Accessing Data
- `list = [ 2.5, 8.9e5, 'rain', [5,9,34.6], None]`
  - `list[2]`
    - 'rain'
  - `list[-1]`
    - None
  - `list[0:2]`
    - `[2.5, 8.9e5]`

# Lists & Tuples

- Functions 'foo(list)' and methods 'list.foo()'
- **list = [ 2.5, 8.9e5, 'rain', [5,9,34.6], None]**
- len(list)
  - 5
- list.count(None)
  - 1
- list.index('rain')
  - 2

# NumPy

- Fundamental package for **scientific computing** in Python
- Functionality for:
  - Multidimensional arrays
  - High-level math functions such as Fourier Transform
  - Pseudorandom number generators

# NumPy

*<https://www.numpy.org/>*

# NumPy

- Lists and Tuples can hold multiple data types
- NumPy arrays: all data stored as same type
- **import numpy as np**
- 1-D, 2-D, ....X-D
  - No limit to the number of dimensions
  - `A = np.array([4,89,-1])`
  - `A = np.array([4.89,-1], dtype=type)`
- 2-D
  - `B = np.array([[23,41,3],[14,92,1]])`

# Accessing NumPy Array Data

- Start counting at 0
- End point non-inclusive
- A colon : means all
- A comma , separates dimensions

# Accessing NumPy Array Data

- 1-D array `A = np.array([100, 8, 54, 33, -500, 2])`
- `A` #All of A
- `A[3]` #Value at index 3
- `A[:4]` #Values from beginning to 4
- `A[4:]` #Values from 4 to end
- `A[::-1]` #All values reverse order

# Accessing NumPy Array Data

- 2-D array `B = np.array([[32, 65, 800, 98],[-9, 43, 28, 150]])`
- `B` #All of B
- `B[1,0]` #Value at row 1 column 0
- `B[:,3]` #Column 3 values for ALL rows
- `B[1:,2]` #Column 2 value for rows 1 to end

# NumPy

- `np.shape(A)` # returns dimensions as tuple
- `np.size(A)` # number of elements
- `len(A)` # number of items of an object

# NumPy Arrays

- `c = np.array([[2.4, -23.73, 0],[0.76, 34, 23.4]], dtype=np.float)`
  - `np.shape(c)`
  - `(2,3)`
- `d = np.zeros((2,3), dtype=np.int)`
- `e = np.ones((4,4), dtype=np.float)`
- `f = np.empty((5,2), dtype=np.float)`
- `g = np.arange(5, 20, 0.5)`
- `h = np.linspace(1, 10, 20)`

# Combine NumPy Arrays

- `np.concatenate((Arr1,Arr2), axis=0)`
- `>>> a = np.array([[1, 2], [3, 4]])`
- `>>> b = np.array([[5, 6]])`
- `>>> np.concatenate((a, b), axis=0)`
- `array([[1, 2],`
- `[3, 4],`
- `[5, 6]])`
- `>>> np.concatenate((a, b.T), axis=1)`
- `array([[1, 2, 5],`
- `[3, 4, 6]])`

*<https://docs.scipy.org/doc/numpy/reference/generated/numpy.concatenate.html>*

# Python For Data Science Cheat Sheet

## NumPy Basics

Learn Python for Data Science interactively at [www.datacamp.com](https://www.datacamp.com)

### NumPy

The NumPy library is the core library for scientific computing in Python. It provides a high-performance multidimensional array object, and tools for working with these arrays.

Use the following import convention:

```
>>> import numpy as np
```

### NumPy Arrays

#### 1D array

```
[1 2 3]
```

#### 2D array

axis 1  
axis 0

```
[[1.5 2. 3.]
 [4. 5. 6.]]
```

#### 3D array

axis 2  
axis 1  
axis 0

```
[[[ 1.  2.  3.]
  [ 4.  5.  6.]]
 [[ 7.  8.  9.]

# In-Class Exercise

- Consider here a small COTS lidar sensor used for 3D mapping and navigation onboard a mobile robot
- As part of a simulation of the lidar sensor's ranging performance, complete the following:
  1. Generate a NumPy array containing 10 numbers sampled from a random normal distribution with mean 30 cm and standard deviation 2.5 cm
  2. Use Python and NumPy to calculate the mean and standard deviation of the array
  3. Repeat the process for arrays containing 100, 1000, and 10000 random numbers
- Thinking ahead: what does this tell us about using sensors for navigation?

# In-Class Exercise

# Matplotlib

- Primary **scientific plotting** library in Python
- Functions for making publication-quality visualizations
  - Line charts
  - Histograms
  - Scatter plots

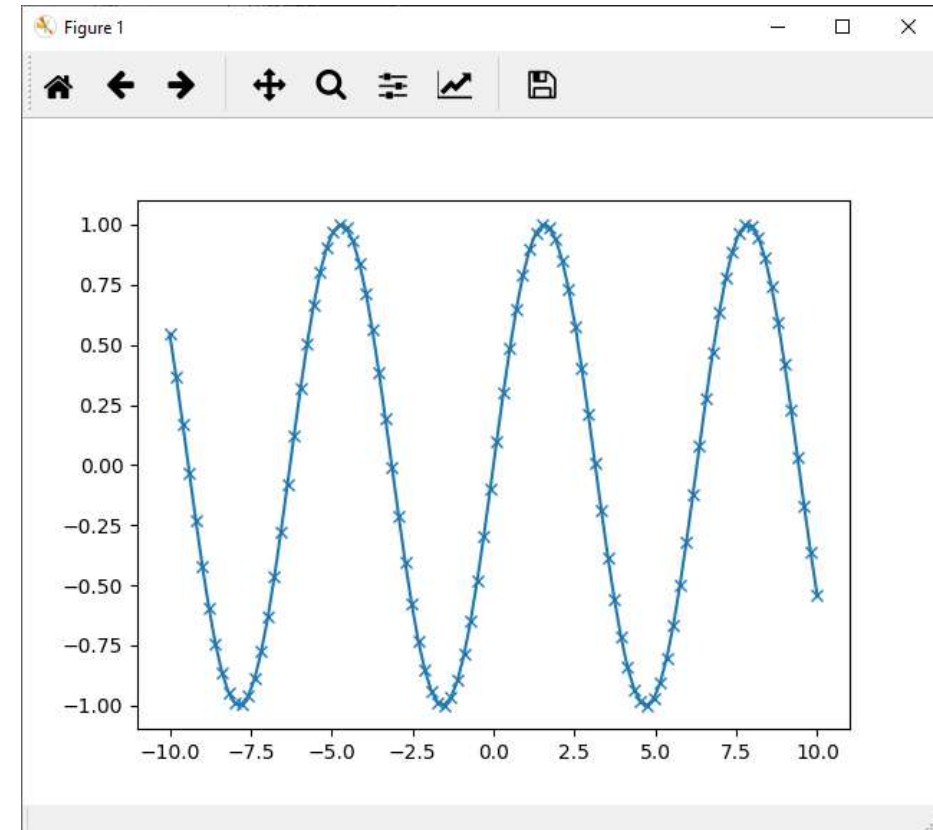

*<https://matplotlib.org/>*

ax[0].plot(x,y,'b-')  
ax[1].plot(x,y,'r--')  
plt.show()
```

## Python For Data Science Cheat Sheet

## Matplotlib

Learn Python interactively at [www.datacamp.com](https://www.datacamp.com)

## Matplotlib

Matplotlib is a Python 2D plotting library which produces publication-quality figures in a variety of hardcopy formats and interactive environments across platforms.

## 1 Prepare The Data

Also see Lists &amp; NumPy

## 1D Data

```
>>> import numpy as np
>>> x = np.linspace(0, 10, 100)
>>> y = np.cos(x)
>>> z = np.sin(x)
```

## 2D Data or Images

```
>>> data = 2 * np.random.random((10, 10))
>>> data2 = 3 * np.random.random((10, 10))
>>> Y, X = np.mgrid[3:3:100, -3:3:100]
>>> U = -1 + X**2 + Y
>>> V = 1 + X - Y**2
>>> from matplotlib.cbook import get_sample_data
>>> img = np.load(get_sample_data('axes_grid/01variate_normal.npy'))
```

## 2 Create Plot

```
>>> import matplotlib.pyplot as plt
```

## Figure

```
>>> fig = plt.figure()
>>> fig2 = plt.figure(figsize=plt.figaspect(2.0))
```

## Axes

All plotting is done with respect to an `Axes`. In most cases, a subplot will fit your needs. A subplot is an axes on a grid system.

```
>>> fig.add_axes()
>>> ax1 = fig.add_subplot(221) # row-col-sum
>>> ax3 = fig.add_subplot(212)
>>> fig3, axes = plt.subplots(nrows=2, ncols=2)
>>> fig4, axes2 = plt.subplots(ncols=3)
```

## 3 Plotting Routines

## 1D Data

```
>>> lines = ax.plot(x,y)
>>> ax.scatter(x,y)
>>> axes[0,0].bar([1,2,3],[3,4,5])
>>> axes[1,0].barh([0.5,1,2.5],[0,1,2])
>>> axes[1,1].axhline(0.45)
>>> axes[0,1].axvline(0.65)
>>> ax.fill(x,y,color='blue')
>>> ax.fill_between(x,y,color='yellow')
```

Draw points with lines or markers connecting them  
Draw unconnected points, scaled or colored  
Plot vertical rectangles (constant width)  
Plot horizontal rectangles (constant height)  
Draw a horizontal line across axes  
Draw a vertical line across axes  
Draw filled polygons  
Fill between y-values and 0

## 2D Data or Images

```
>>> fig, ax = plt.subplots()
>>> im = ax.imshow(img,
>>>                  cmap='gist_earth',
>>>                  interpolation='nearest',
>>>                  vmin=-2,
>>>                  vmax=2)
```

Colormapped or RGB arrays

## Plot Anatomy &amp; Workflow

## Plot Anatomy

## Workflow

The basic steps to creating plots with matplotlib are:

- 1 Prepare data
- 2 Create plot
- 3 Plot
- 4 Customize plot
- 5 Save plot
- 6 Show plot

```
>>> import matplotlib.pyplot as plt
>>> x = [1,2,3,4]
>>> y = [10,20,25,30]
>>> fig = plt.figure()
>>> ax = fig.add_subplot(111)
>>> ax.plot(x, y, color='lightblue', linewidth=3)
>>> ax.scatter([2,4,6],
>>>            [5,15,25],
>>>            color='darkgreen',
>>>            marker='^')
>>> ax.set_xlim(1, 6.5)
>>> plt.savefig('foo.png')
>>> plt.show()
```

## 4 Customize Plot

## Colors, Color Bars &amp; Color Maps

```
>>> plt.plot(x, x, x, x**2, x, x**3)
>>> ax.plot(x, y, alpha=0.4)
>>> ax.plot(x, y, c='k')
>>> fig.colorbar(im, orientation='horizontal')
>>> im = ax.imshow(img,
>>>                  cmap='seismic')
```

## Markers

```
>>> fig, ax = plt.subplots()
>>> ax.scatter(x,y,marker=".")
>>> ax.plot(x,y,marker="o")
```

## Linestyles

```
>>> plt.plot(x,y,linewidth=4.0)
>>> plt.plot(x,y,ls='solid')
>>> plt.plot(x,y,ls='--')
>>> plt.plot(x,y,'--',x**2,y**2,'-.')
>>> plt.setp(lines,color='z',linewidth=4.0)
```

## Text &amp; Annotations

```
>>> ax.text(1,
>>>         -2.1,
>>>         'Example Graph',
>>>         style='italic')
>>> ax.annotate("Sine",
>>>             xy=(8, 0),
>>>             xycoords='data',
>>>             xytext=(10.5, 0),
>>>             textcoords='data',
>>>             arrowprops=dict(arrowstyle="->",
>>>                             connectionstyle="arc3"),)
```

## Mathtext

```
>>> plt.title(r'$\sigma_i=15$', fontsize=20)
```

## Limits, Legends &amp; Layouts

## Limits &amp; Autoscaling

```
>>> ax.margins(x=0.0,y=0.1)
>>> ax.axis('equal')
>>> ax.set_xlim=[0,10.5],ylim=[-1.5,1.5])
>>> ax.set_xlim(0,10.5)
```

## Legends

```
>>> ax.set(title='An Example Axes',
>>>         ylabel='Y-Axis',
>>>         xlabel='X-Axis')
>>> ax.legend(loc='best')
```

## Ticks

```
>>> ax.xaxis.set(ticks=range(1,5),
>>>               ticklabels=[3,100,-12,"foo"])
>>> ax.tick_params(axis='y',
>>>                 direction='inout',
>>>                 length=10)
```

## Subplot Spacing

```
>>> fig3.subplots_adjust(wspace=0.5,
>>>                       hspace=0.3,
>>>                       left=0.125,
>>>                       right=0.9,
>>>                       top=0.9,
>>>                       bottom=0.1)
```

## fig.tight\_layout()

## Axis Spines

```
>>> ax1.spines['top'].set_visible(False)
>>> ax1.spines['bottom'].set_position(('outward',10))
```

Add padding to a plot  
Set the aspect ratio of the plot to 1  
Set limits for x and y-axis  
Set limits for x-axis

Set a title and x and y-axis labels

No overlapping plot elements

Manually set x-ticks

Make y-ticks longer and go in and out

Adjust the spacing between subplots

Fit subplot(s) in to the figure area

Make the top axis line for a plot invisible  
Move the bottom axis line outward

## 5 Save Plot

## Save figures

```
>>> plt.savefig('foo.png')
```

## Save transparent figures

```
>>> plt.savefig('foo.png', transparent=True)
```

## 6 Show Plot

```
>>> plt.show()
```

## Close &amp; Clear

```
>>> plt.cla()
>>> plt.clf()
>>> plt.close()
```

Clear an axis  
Clear the entire figure  
Close a window

# Functions

- `def function_name(inputA, inputB, inputC):`  
    `do some stuff`  
    `do more stuff`  
    `return (x,y)`
- `def square_of_x(x):`  
    `return x**2`

# Variables in Functions

- Variables used in functions are completely separate from variables outside the function
- X inside the function is NOT the same as X in the rest of your script
- To change the value of a variable outside the function you must declare
  - `global x`
  - `x = 10`
